

Use cases

This list describes use cases (http://en.wikipedia.org/wiki/Use_case) and the respective sequences of events that supply you with the desired results using YaCy.

Search Functions

Alternative Web Search

You are looking for www documents, but - for different reasons (availability, censorship, other search portals' ranking and sorting) - you want to find websites that have been indexed by a community of independent or topic-oriented (see: different networks; freeworld; TOR; sciencenet) YaCy peers.

- Install (../download_installation/) a YaCy standard release without any modifications.
- Open and use the YaCy search page.

Portal Search

You own a web portal and need a search function for your pages. Users of your website shall be able to find documents within your site or its sub-domains. Users of the public YaCy network (freeworld) shall get results containing links to your site.

- Install (../download_installation/) YaCy on your (v)server.
- Switch to Robinson mode (unilateral index separation from other users).
- Start a web crawl (../operation/crawlstart_p/) that is restricted to your domain.
- Integrate the YaCy search page into your web portal.

Topic Search

You own a web portal on a special-interest topic and want to change it into a search portal which offers a web search especially on this subject. Your users shall be able to get search results from your site and the sites you recommended alike from a single search dialogue.

- Install (../download_installation/) YaCy on your (v)server.
- Switch to Robinson mode (unilateral index separation from other users).

- Start several web crawls (../operation/crawlstart_p/) that are restricted to your domain and the ones you want to include.
- Integrate the YaCy search page into your web portal.

Intranet Search

An intranet you administer needs a search function. Users of this search shall be able to reach all pages of your intranet from a single search page. (Use similar to a 'search appliance'; see: GSA)

- Install (../download_installation/) YaCy on a server inside your intranet.
- Reconfigure the standard network affiliation to 'intranet'.
- Start an unrestricted web crawl (../operation/crawlstart_p/) with a page on your intranet (if interlinking exists) or to several pages, one for each intranet server.
- Integrate the YaCy search page into your intranet portal.

Collaborative Desktop Indexing

You and your colleagues need a common search function for documents which are stored on your private computers and not on shared drives. Each member of the group can restrict the shared use to certain documents. All documents are to be published via a web service. A search shall include all shared documents. Other persons' frequently-used documents are to be accessed by means of a bookmark function.

- All group members install (../download_installation/) YaCy on their computers.
- Reconfigure the standard network affiliation to 'intranet'.
- All users publish their documents to be shared in their <yacy-home>/DATA/HTDOCS/repository/ directory.
- Everybody starts a web crawl (../operation/crawlstart_p/) at the address `http://<local-ip>:8090/repository/`.
- All users can find all their own documents and those of the other team members through their own YaCy search page
- Found documents will be served automatically through YaCy's built-in web server.
- Found documents can be bookmarked by means of YaCy's built-in function.
- Users can publish their bookmarks.
- Other users' published bookmarks can be imported as private ones.

Personal Web Assistance

Personal Bookmark Server

You have a huge number of bookmarks on your private and on your company computer. You want to use all of them on both computers without publishing them. While you are on a journey, you also want to be able to access your personal bookmarks from any computer.

- Install (../download_installation/) YaCy on your home computer and enable public access via dyndns or install YaCy on a (v)server on the internet.
- Export your bookmarks to YaCy. They can be accessed by tags.
- For each entry, you can select if it is to be public or private.
- On your company computer, you can access your bookmarks, for instance, through the YaCyBar (<https://github.com/yacy/YaCyBar>) (Firefox plug-in) or the YaCy web front-end.
- While on a journey, you can access your bookmarks through the YaCy web front-end.

Web Analysis

Detection of All Dead Links on Your Web Portal

You administer a web portal and want to remove faulty links from your site.

- Install (../download_installation/) YaCy.
- Switch to Robinson mode (unilateral index separation from other users).
- Start a web crawl (../operation/crawlstart_p/) that is restricted to the domain to be checked.
- Examine the crawl log and filter out all messages about unreachable pages.
- Use the unix/linux strings command to extract a comprehensive list of all dead links.

Generation of a Domain List

You need a list of domain names which are accessible on-line and provide contents.

- Install (../download_installation/) YaCy.
- Start a web crawl (../operation/crawlstart_p/) A good starting point is a highly-interlinked portal page.
- Use the built-in export function for URL and domain lists. You can refine the exports using filters.

Products

YaCy is both the name of a project and the name of a software. Our main 'product' (it's free-software) is the YaCy Search Server.

GDPR Compliance

YaCy has a strong connection to privacy-aware tools. As such it does not collect personalized data. It also has no 'phoning-home' integrated. This web page does not use cookies. However, linked services may have cookies.

Company

The brand 'YaCy' is owned by a private company. While the software YaCy is a non-profit, we also provide consulting for YaCy and search-related business topics. To run the non-profit YaCy project we heavily depend on community support either as contribution to our software and documentation or as donations. Please donate! To contact us, please see [Impressum \(/impressum/\)](/impressum/)
